Night status page — spec

service	sched-prod
owner	rune
from	product
state	draft for the build

What it is

A public page that says what happened to sched-prod during the night, so support can point people at one link instead of answering the same question again.

It is a page people read and a JSON other systems read. Both say the same thing.

Requirements

Tagged ones are the ones we hold the build to. Untagged lines are context.

> One row per incident: when it opened, when it closed, what it touched.

> **`R-L2Z`** — Newest incident at the top.

> **`R-K5Z`** — Each incident names who ran it.

> Keep it plain. No login, no tracking, no cookie banner.

Data

Incidents come from the ops feed, on the course site: `/challenges/status-for-the-night/api/incidents/111cc74e5b37`. It is JSON and updates through the night.

The page's own JSON is `status.json`, beside the page. Its fields: `updatedAt` (when the data was read) and `incidents` (the rows).

Formats

> Times in 24-hour form, HH:MM.

> **R-Z2L** — Dates are shown day first: 03/11. This is the format the night shift writes in its notes.

Scope

> **R-K8X** — Last night only. Nothing older stays on the page.

> Out of scope: search, subscriptions.
